Proper storage of elastomers

Some elastomer parts are stored for long periods. This can affect product quality. Changes are the result of individual or combined influences of special factors, such as deformation, oxygen, ozone, light, heat, moisture, oils and solvents. For this reason, precautions must be taken to ensure that the service life will not be considerably shortened by incorrect storage. Storage and the recording of time in storage is governed by ISO 2230 and DIN 7716.

HEAT

- > Storage temperature of elastomers should preferably be between +5 °C and +25 °C.
- > Direct contact with heat sources (such as radiators) or direct sunlight should be avoided.
- > Storage at low temperatures can cause elastomers to harden. In this temperature range, therefore, moulded parts must be handled with great care to avoid deformations.

MOISTURE

- > Relative humidity in storage areas should be below 70 %. Avoid extremely wet or dry conditions. No condensation should be present.

LIGHT, OZONE

- > Elastomer parts should be stored away from light sources and ozone. In particular, direct sunlight or strong artificial light containing an ultraviolet band should be avoided. The use of individual containers, especially plastic bags, is preferred, provided they are UV-protected.

DEFORMATION

- > Elastomer components should be stored free of compressions or deformations and in an unbent state. Items delivered in an unbent state should be kept in their original packaging.

CONTACT WITH LIQUIDS OR GREASE

- > Moulded elastomer parts should not come into contact during storage with solvents, oils or grease, if not already so packed by the manufacturer.

CONTACT WITH METAL AND NON-FERROUS METALS

- > Direct contact with certain metals such as manganese, iron, copper and its alloys, e.g. brass, damages some elastomers and should be avoided during storage.
- > Due to the potential for plasticiser migration or migration of other components, elastomers should not be stored in contact with PVCs.

Proper storage of elastomers

LENGTH OF STORAGE AND INSPECTION (EMPIRICAL VALUES)

The useful life of elastomeric products depends to a considerable degree on the type of elastomer. If the above-mentioned recommendations for storage are observed, the various elastomers can be stored for the times given below:

AU, EU, BR, SBR, NR, thermoplastics	4 years	After the specified time, moulded elastomer parts should be inspected. An extension of shelf life is then possible. Elastomer parts and components less than 1.5 mm thick are more susceptible to attack by oxidation, even when stored under ideal conditions as recommended. The inspection interval should therefore be shorter than indicated above.
NBR, HNBR, CR	6 years	
EPDM	8 years	
FKM, SI, SI-FS	10 years	

IMPORTANT INFORMATION ON THE STORAGE OF POLYURETHANE (AU/EU)

PE bags are used exclusively for safe transport and not for permanent storage.

Polyurethane products must not be stored in sealed PE bags (hydrolysis aging). Polyurethane articles are best stored unpacked.

When storing in cartons or other containers, ensure adequate ventilation (normal air circulation in the storage room is sufficient).

Polyurethane can be stored in PE bags only if the bag is not sealed. When stored in sealed PE bags, the polyurethane is destroyed by hydrolysis.

Optimal storage conditions:

Temperature: room temperature (+5 to +25 °C)

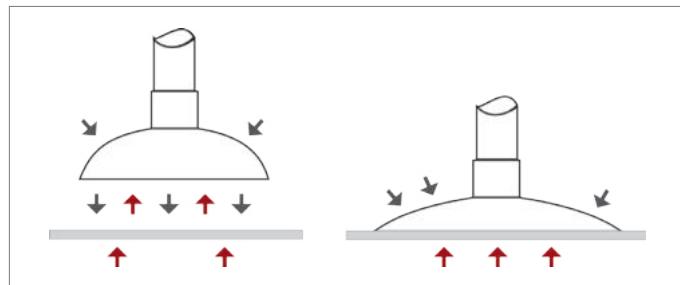

Humidity: ca. 30 % to 70 %

Air exchange: air circulation at the storage place is necessary

General explanation for vacuum cups

Functional principle

It is not the vacuum unit that sucks up the workpiece to be moved, but the good to be handled that is pressed firmly to the vacuum unit. This happens due to the negative pressure that is created by the built-in vacuum cup or the connected vacuum generator.

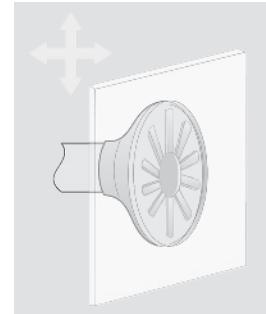

The functional principle is straightforward: The vacuum generator draws out the air located between the vacuum cup and workpiece. After contact, the vacuum cup seals off the workpiece surface against the surrounding air pressure. The underpressure or vacuum is created.

Depending on the application, different shapes and sizes of vacuum cups and vacuum cup materials are used.

Example:

For handling movements parallel to the vacuum surface, flat vacuum cups with cleats or knobs are especially suitable because of their high frictional resistance.

Calculation of the holding forces

The force exerted by a vacuum cup holding or lifting a workpiece depends on many factors. These include the acceleration, the safety factor, turning and tilting moments, the elasticity of the material and even the design of the vacuum cup.

Regardless of such factors, the holding power of a vacuum cup can easily be identified by the following formula:

$$\text{Holding power in N} = \frac{\text{active suction surface in cm}^2 \times \text{vacuum available in \%}}{10}$$

In short form:

$$F = \frac{A \times P}{10}$$

The following applies: The holding power of a vacuum cup is proportional to the active suction surface.

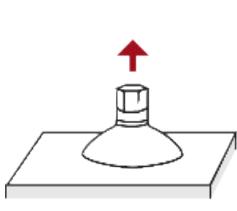

To determine the necessary vacuum cup diameter or the required active suction surface, the following formula helps:

$$\text{Vacuum cup diameter in mm} = 113 \times \sqrt{\frac{\text{Weight in kg} \times \text{Safety factor}}{\text{Underpressure in \%} \times \text{Number of vacuum cups}}}$$

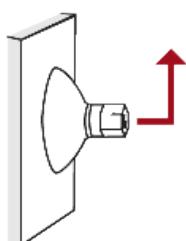

On page 465 you will find a table with average values for vacuum cups in standard applications.

Important: The safety factor (dependent on the lifting direction)

Flat vacuum cups series

Flat vacuum cups for separating porous products – SFU-RT

Flat vacuum cups for separating porous products – SFU-RT

Product notes

Patented flat vacuum cups for stacking of partially air-permeable plate material that air is drawn through. Separates uppermost plate layer from underlying plate layers. Soft sealing lip made of abrasion-resistant NR. Secure handling even of rough surfaces thanks to additional internal safety sealing lip. High stability under lateral forces. Cost-effective replacement of the wear part, as it comes in two parts.

Ordering notes

Elastomer seal and carrier plate 270.380 must be ordered separately

102.160.380.4	SFU-RT-160		NR (bg)	270.380

Functional principle

Task: Access the top layer of porous materials without carrying along the lower layers.
Simultaneous intake (outer chamber) and selective blowing in a separate central chamber breaks adhesive forces between the layers.
The unwanted take-up of lower layers is prevented.
The air pressure level should be between 1 and 3 bar (14.5 and 43.5 psi) and is dependent on the nature of the product.

Bellows vacuum cups series

High-temperature Thermalon®-flocked bellows cups, 1.5 folds – SKT-B1

High-temperature Thermalon®-flocked bellows cups, 1.5 folds – SKT-B1

Product notes

Bellows vacuum cup made of proven Thermalon® with additional patented flock coating of the contact surfaces for the highest demands on non-marking gripping.

Ideally suited for uneven surfaces with special suitability for the removal of hot plastic parts to be painted from the injection molding machine.

Thermalon® is a material mixture with a hardness of 60° Shore A, specially optimized for the plastics industry.

Flock coating made of thin polyamide layer PA6.6 black.
Connection by means of plug nipple.

Advantage

- > Nearly non-marking
- > Quick depositing of the product, as there is no static friction due to thin flock coating
- > Free of silicone and other paint-wetting-impairment substances (PWIS)
- > Bellows compensates for height differences and allows good adaptation to curved or uneven product surfaces
- > Temperature-resistant up to 160 °C (320 °F)

Notes:

The flock coating could cause leakage, which must be taken into account in the layout of the vacuum source.

Bellows vacuum cups series

High-temperature Thermalon®-flocked bellows cups, 2.5 folds – SKT-B2

High-temperature Thermalon®-flocked bellows cups, 2.5 folds – SKT-B2

Product notes

Bellows vacuum cup made of proven Thermalon® with additional patented flock coating of the contact surfaces for the highest demands on non-marking gripping.

Ideally suited for uneven surfaces with special suitability for the removal of hot plastic parts to be painted from the injection molding machine.

Thermalon® is a material mixture with a hardness of 60° Shore A, specially optimized for the plastics industry.

Flock coating made of thin polyamide layer PA6.6 black.
Connection by means of plug nipple.

Advantage

- > Nearly non-marking
- > Quick depositing of the product, as there is no static friction due to thin flock coating
- > Free of silicone and other paint-wetting-impairment substances (PWIS)
- > Large suction stroke and good adaptation to curved or uneven product surfaces
- > • Temperature-resistant up to 160 °C (320 °F)

Notes:

The flock coating could cause leakage, which must be taken into account in the layout of the vacuum source.

Bellows vacuum cups series

Bellows vacuum suction plates Softgrip – SBPL-SG

Bellows vacuum suction plates Softgrip – SBPL-SG

Product notes

Vacuum suction plate with 1.5 folds for gentle handling of heavy but sensitive products (e.g. glass plates). Divided support surfaces prevent deformation of the product and provide a firm grip. Additional safety sealing lip on the support block positions the product orthogonally to the ground.

Connection via an interlocking, snap-in aluminum plate.

Advantage

- > Very careful handling due to soft sealing lip and lightly compressing bellows
- > Cleats provide product support
- > Cost-effective replacement of worn seals

Oval vacuum cups series

Oval vacuum cups, flat – SO-E

Oval vacuum cups, flat – SO-E

Product notes

Small flat vacuum cups in oval design for elongated workpieces where only minimal space is available (e.g. semiconductors, carrier plates, etc.). Connection via an interlocking snap-in plug-in nipple.

Advantage

- > Significantly increased suction force compared to round vacuum cups of the same width
- > Optimum bending strength due to elongated carrier plate in the plug-in nipple
- > Secured against rotation
- > Cost-effective replacement of worn seals

Ordering notes

The cups are delivered fully assembled with fitting.

Notes:

Special vacuum cups

High temperature vacuum cups with felt pad – SX-F

HEAT RESISTANT & LOW MARKING

Product notes

Almost mark-free special vacuum cup for high temperature requirements, e.g. in the glass industry.
Special felt pad vulcanized to elastomer carrier. Migration of silicone particles is prevented by vapour-deposited aluminum layer.
Connection up to Ø 70 mm by means of plug-in nipple, from Ø 90 mm with bolted bracket plate.

Advantage

- > Temperature-resistant up to 500 °C (932 °F) (SI)
- > Almost mark-free
- > Cost-effective replacement of worn seals

Notes:

There is a small leak at first use resulting from the texture of the special felt, but after a brief period of use this will be significantly reduced by the thickening of the felt layer.

Vacuum cups accessories | Lifting cylinders

Vacuum lifting cylinders – operated by compressed air, for flat suction picking

Vacuum lifting cylinders – operated by compressed air, for flat suction picking

For flat suction picking, e.g. for vacuum cup series SFU-F Ø 4 - 15 mm

Product notes

- > Stacking and destacking of workpieces
- > Vacuum generation by compressed air using an integrated ejector
- > Lifting cylinder extended during idle state
- > Cycle time independent of stroke and weight
- > Vacuum cups can be found in chapter vacuum cups series, flat vacuum cups SFU-F Ø 4 - 15 mm and bellows vacuum cups SBF-B Ø 6 - 15 mm

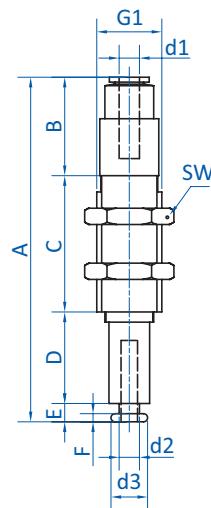

Note

- > Minimize rotating load or load on the ejector and shaft parts from the transverse direction. These can shorten the service life of the lifting cylinder.

Vacuum cups accessories | Lifting cylinders

Vacuum lifting cylinders, for high suction picking – operated by compressed air

Vacuum lifting cylinders, for high suction picking – operated by compressed air

For high suction picking, e.g. for vacuum cup series SFU-F Ø 20 - 40 mm

Product notes

- > Stacking and destacking of workpieces
- > Vacuum generation by compressed air using an integrated ejector
- > Lifting cylinder extended during idle state
- > Cycle time independent of stroke and weight
- > Vacuum cups can be found in chapter vacuum cups series, flat vacuum cups SFU-F Ø 20 - 40 mm and bellow vacuum cups SBF-B Ø 20 mm
- >

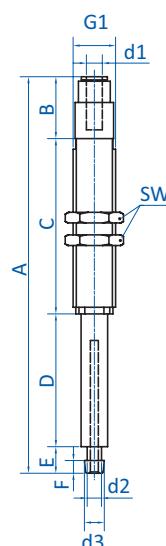

Note

- > Minimize rotating load or load on the ejector and shaft parts from the transverse direction. These can shorten the service life of the lifting cylinder.
